WHAT IS NITO CASH?

The first shielded pool for ParyonUSD (PUSD) on Bitcoin Cash

Move PUSD through a covenant pool and your **sender, receiver and amount all disappear** from the chain — payments verified by a zero-knowledge proof.

github.com/APECSdev/nito.cash

The 2026 upgrade let a transaction verify a zk-proof by itself…

…so we asked: **what if a stablecoin payment could look like nothing at all?** We built the pool — a **covenant** that holds the tokens, a **Groth16 circuit** that hides the payers, and a wallet that **proves everything in your browser**. No backend. No custodian. Nothing to trust but math.

BENEFITS OF NITO CASH

Why shield your PUSD?

- Payments that look like nothing — sender, receiver & amount masked
- Variable amounts — no fixed denominations, no round-number tells
- Keys never leave your device — BIP39/BIP32 + Schnorr, all local
- Notes sealed with AES-256-GCM; only ciphertext ever persists
- 10x less chain-snooping!

BCH USAGE

Shield → pay → unshield, in ~37 KB transactions

One transaction carries the **2-public-input Groth16 proof** and the covenant state transition. On chipnet, the full lifecycle is confirmed — and **three private payments settled in ONE block** (329764).

Try the live wallet: **nito.cash**

THE VISION FOR NITO CASH

From one pool to a private economy

- Nito Vault — shield **any** CashToken (the circuit already carries the asset category)
- ○Stablecoin mode — hold incoming BCH as PUSD / MUSD, pay out privately
- WizardConnect + XO dApp-connect — pay privately from any wallet
- Mainnet after a full MPC trusted setup (chipnet is the rehearsal)

THANK YOU!
